

Denver Ind. Co., Ltd.

Heavy oil country lathes/ CNC heavy oil country lathes

Denver Ind. Co., Ltd., founded in Taiwan in 1972, makes lathes, milling machines, and built-to-order machines for buyers from all over the world.

The company is currently promoting its HL, HK, DHL, DHK and RHL series of heavy-duty lathes, which are laden with useful features. They have spindle bores that range from 6, 9, 10, 12 and 15 inches in diameter and working beds that come in widths of 24 inches, 32 inches and 49 inches. Their swing-over beds range from 960mm, 1,120mm, and 1,220mm to 2,000mm in diameter, and distance between centers 1,500mm-8,000mm in the Z axis.

The working beds on these series of machines are made of high-torque, one-piece Meehanite die-cast iron made with induction, hardening, and grinding processes. All series are ideal tools for cutting the huge workpieces and steel rods used in heavy industries like oil pipe, aerospace, and heavy-duty shaft manufacturing.

The RHL series is outfitted with five guideways designed for independent travel of the carriage and tailstock, thus achieving cutting stability beyond the capability of dual guide way designs.

In addition to these families of machines, the company has developed heavy-duty precision CNC facing lathes featuring a middle-mounted Z-axis ballscrew.

Denver Ind. builds all of its machines in Taiwan with well-trained personnel, guaranteeing good quality and efficient service. The company has won CE certification, attesting to quality that is acceptable to the European market.

In addition to Europe, the company's machines go to the United States, Russia, United Kingdom, and Asia, carrying either its own "Denver" brand or the brands of its buyers. Currently, customized machines account for most of the company's revenue.
